

Rapport d'activité du Collège de médecins pour la mère et le nouveau-né
(section néonatalogie)
Année 2010 et perspectives 2011-2012

Président : Dr. D Haumont

**Membres : Drs. L Cornette, J-P. Langhendries, C. Lecart, K. Mathé, J. Rigo,
H. Van Hauthem, P. Van Reempts.**

Administration: Dr. A Clercx.

Représentant du GBN-BVN (Groupement Belge de Néonatalogie - Belgische Vereniging voor Neonatologie): Dr. B Van Overmeire

1. Le site web: Newborn College

Le collège a effectué un travail important pour la nouvelle application web de la récolte des données. En effet fin 2009 il a été décidé de ne plus travailler avec la firme Orbis pour le développement mais de confier celui-ci à Monsieur C. Nguyenba du CHU Saint-Pierre. L'application web permet un enregistrement on line ou un import à partir de fichiers existants. Tous les items du Nicaudit et de Euroneonet sont inclus dans l'enregistrement. Le benchmarking, l'analyse des tendances et les rapports peuvent être créés par les utilisateurs. Toutes les données enregistrées au cours des années précédentes ont été récupérées sur le site. A titre d'exemple 2 rapports cumulatifs sont joints en annexes comparant les années 2004-2006 à 2007-2009 (Annual report). Des contacts avec Euroneonet sont en cours pour l'export vers le benchmarking européen.

2. Le flux des données

L'encodage des données constitue un problème récurrent en médecine périnatale. Afin de permettre un enregistrement plus fiable et non redondant différentes démarches ont été effectuées envers les autres plateformes électroniques eHealth et eBirth. Un document reprenant tous les aspects des flux des données a été envoyé à tous les chefs de service Nic et est joint en annexe (Dataflow Nic). L'intégration des données obligatoires de la déclaration de naissance électronique eBirth dans le site Newborn College fait l'objet d'une collaboration avec la firme HealthConnect et devrait pouvoir être financé de manière complémentaire.

3. Le projet qualité autour des infections nosocomiales: NeoKiss

La mission des collèges porte sur un enregistrement ayant pour résultat une amélioration de la qualité des soins. Les infections nosocomiales ont un impact considérable sur la morbidité et la mortalité en néonatalogie. L'année 2011 sera consacrée à la mise en route d'un outil de surveillance et de feedback de ces infections. Un projet similaire a été initié en 1999 en Allemagne (NeoKiss). La réduction significative des infections a rendu l'enregistrement

obligatoire. Un groupe de travail en collaboration avec l’Institut de Santé Publique et la “Belgian Infection Control Society” a été mis en place pour piloter le projet.

4. L’enregistrement des données de follow-up

Un financement du follow-up par l’INAMI a été accordé. Ce financement fait l’objet d’une réflexion quant aux modalités pratiques. Il est probable que le financement sera lié à un enregistrement minimal. Le Collège confirme sa volonté d’assurer l’enregistrement d’un “minimal dataset” en concordance avec les items de la base Euroneonet et en collaboration avec le groupe de travail de la Société Scientifique GBN-BVN.

5. Contrat de Collaboration avec C.Nguyenba pour le site web

La reprise du site web par le service informatique du CHU Saint-Pierre est une étape transitoire. L’extension de l’application nécessite une structuration de la collaboration informatique. Les modalités de collaboration sont reprises en annexe.

Abbreviations

AT	Antenatal transfer
BPD	Bronchopulmonary dysplasia
CLD	Chronic lung disease
ENM	Early neonatal mortality
GA	Gestational age
IB	Inborn
IC	Intracerebral hemorrhage
IHM	In hospital mortality
IUT	Intra uterine transfer
LNM	Late neonatal mortality
N	Number
OB	Outborn
PC25	25th percentile or lower quartile
PC75	75th percentile or upper quartile
PDA	Persistent ductus arteriosus
PMA	postmenstrual age

Remarks

ATTENTION ! Until 2008 (included) the database selects only patients < 1500g when comparisons or globalisations among Nic's are made.
Starting in 2009 all baby's <1500g or < 32 w are included.
Only in the annual report of your own Nic you can select according gestational age even before 2009 if you had entered all your patients.

Occurrences:

Some items allow multiple entry and will be counted as occurrences. Occurrences can be patients or events, treatments etc
Percentages can be calculated according to events or to patients. Sometimes the sum of the percentages can exceed 100.

Definitions

IC hemorrhage grade >2 includes:

- Focal periventricular hemorrhagic infarction
- Intraventricular hemorrhage with dilatation
- Cerebellar hemorrhage
- Subarachnoidal hemorrhage
- Thalamoventricular hemorrhage
- Lobar cerebral hemorrhage
- Extensive periventricular hemorrhagic infarction
- Sub- or epidural hemorrhage

CLD at 36 weeks

Starting 2009 definitions have changed. In order not to loose the previous information following (imperfect) equivalence have been used:

	before 2009	after 2009
No BPD	No BPD	No BPD
Mild BPD	No O2 but Cpap	Grade I
Moderate/severe	O2 at 36w or art ventilation	Grade II/III

Participating NIC units

Year	Number of NIC units

3.M.2. <i>Care over GA</i>	38

**Abbreviations**

AT	Antenatal transfer
BPD	Bronchopulmonary dysplasia
CLD	Chronic lung disease
ENM	Early neonatal mortality
GA	Gestational age
IB	Inborn
IC	Intracerebral hemorrhage
IHM	In hospital mortality
IUT	Intra uterine transfer
LNM	Late neonatal mortality
N	Number
OB	Outborn
PC25	25th percentile or lower quartile
PC75	75th percentile or upper quartile
PDA	Persistent ductus arteriosus
PMA	postmenstrual age

Remarks

ATTENTION ! Until 2008 (included) the database selects only patients < 1500g when comparisons or globalisations among Nic's are made.
Starting in 2009 all baby's <1500g or < 32 w are included.
Only in the annual report of your own Nic you can select according gestational age even before 2009 if you had entered all your patients.

Occurrences:

Some items allow multiple entry and will be counted as occurrences. Occurrences can be patients or events, treatments etc
Percentages can be calculated according to events or to patients. Sometimes the sum of the percentages can exceed 100.

Definitions

IC hemorrhage grade >2 includes:

- Focal periventricular hemorrhagic infarction
- Intraventricular hemorrhage with dilatation
- Cerebellar hemorrhage
- Subarachnoidal hemorrhage
- Thalamoventricular hemorrhage
- Lobar cerebral hemorrhage
- Extensive periventricular hemorrhagic infarction
- Sub- or epidural hemorrhage

CLD at 36 weeks

Starting 2009 definitions have changed. In order not to loose the previous information following (imperfect) equivalence have been used:

	before 2009	after 2009
No BPD	No BPD	No BPD
Mild BPD	No O2 but Cpap	Grade I
Moderate/severe	O2 at 36w or art ventilation	Grade II/III

**Flux des données collectées par le Collège Mère - Nouveau-né (Section Néonatalogie)
Intégration dans les différentes plate formes électroniques du Ministère de la Santé SPF
e Birth - e Health - Newborn College
FIABILITE ET CONFIDENTIALITE**

I. Situation actuelle de la base de données du Collège de Néonatalogie

Le Collège de néonatalogie enregistre des données néonatales concernant les prématurés d'âge gestationnel inférieur à 32 semaines ou de poids de naissance inférieur à 1500g. Trois des 40 items « historiques » ont été récemment modifiés et complétés par les items de Euroneonet. Environ 1-1.5% des naissances sont concernées par cet enregistrement (1500-1800 patients/an).

L'enregistrement actuel a fait l'objet d'une **déclaration à la Commission de la Protection de la Vie Privée (CPVP)** pour l'ensemble des Collèges introduite en **2002** par Monsieur C. Decoster, secrétaire général de l'Administration des Etablissements de Soins. Une nouvelle déclaration a été introduite cette année puisque nous projetons d'y inclure des données de follow-up et que le Collège souhaitait avoir la confirmation de la conformité de sa banque de données.

Cette conformité a été confirmée par la CPVP. Toutefois, il nous a été rappelé que chaque centre doit être en règle vis-à-vis de la CPVP par rapport à la gestion de banques de données de ses propres patients. Ceci peut se faire par une déclaration de l'hôpital pour l'ensemble de ses services. Dans certains cas un service doit faire une déclaration spécifique si les données sont utilisées à d'autres fins que celles pour lesquelles l'hôpital a fait sa déclaration.

La base de données est gérée en toute confidentialité par le Président du Collège sous la responsabilité du SPF Santé Publique. Le site sécurisé actuel qui héberge les données des prématurés s'intitule « Newborn College » et est confié au service informatique du CHU Saint-Pierre. Le site permet une utilisation interactive de benchmarking et de tendances.

Anonymisation des données du patient

La base de données ne contient pas les données nominatives du patient à savoir le nom, prénom, l'identification de la maman, le n° de registre national.

Actuellement elle contient un n° interne qui dans le futur sera remplacé par le partus number défini dans le système eBirth.

Accès à la base de données

L'accès à l'application se fait par Internet avec le protocole d'encryptage ([https](https://)). Ceci permet l'impossibilité à tout intermédiaire malveillant dans le réseau internet de pouvoir accéder à la transmission. L'utilisateur accède par un login avec mot de passe. Dans le futur, le login se fera par eHealth. L'utilisateur ne peut voir que les patients de son propre hôpital. Il lui est impossible de visualiser les données de patients d'un autre hôpital. Tout accès aux données d'un patient est enregistré dans une table d'audit.

Sécurisation de la base de données

La base de données est située dans un des serveurs de la salle des serveurs de l'hôpital CHU Saint-Pierre. L'accès à cette salle se fait par un badge et est limité aux responsables système et aux responsables de la maintenance de la salle. Tout accès à cette salle est enregistré dans un fichier journal qui permet de savoir qui et quand une personne est entrée dans la salle.

La salle des serveurs est équipée d'éléments permettant la haute disponibilité à savoir :

- Redondance électrique (courant normal, courant secours)
- Redondance de la climatisation
- Redondance des éléments du réseau
- Redondance des serveurs
- Redondance des disques de stockages.

La base de données est régulièrement sauvegardée quotidiennement sur disque et sur bande.

Base légale

L'enregistrement s'effectue sur base volontaire par les services NIC. L'évaluation externe de la qualité par le collège est néanmoins une obligation légale (AR du 15 février 1999 relatif à l'évaluation qualitative de l'activité médicale à l'hôpital).

L'enregistrement actuel comporte 2 problèmes :

1. Incomplétude lié à l'absence de participation de certains services : espoir d'évolution favorable.
2. Problèmes administratifs quant à la fiabilité de la liste des patients enregistrés :
 - A. Il ne permet pas d'éviter les **doublons** car il n'existe pas de numéro unique par enfant; par ex. un enfant ayant séjourné dans 2 ou plusieurs services NIC risque d'être encodé plusieurs fois.
 - B. Il n'existe aucun contrôle sur le côté **complet** de l'enregistrement puisque celui-ci dépend exclusivement de la bonne volonté des services Nic.

II. Perspectives d'évolution de la base de données : inclusion de données de suivi

Il est prévu de compléter les données de la période néonatale par des informations sur le devenir des enfants à quelques âges clé (2 ans, 5- 6 ans et éventuellement ultérieurement). Les **personnes susceptibles d'encoder** des données de suivi n'appartiendront pas nécessairement aux services NIC et devront pouvoir utiliser un login différent de la période néonatale. Il est souhaitable que le login des différents soignants soit personnalisé. Les informations récoltées sont de nature sensibles puisque ayant pour but d'évaluer l'impact de la prématureté sur le **développement** moteur, cognitif, neurosensoriel et comportemental. Des mesures particulières concernant la **confidentialité** et le type d'accès sont nécessaires.

Dans un souci d'amélioration de l'exactitude des données et de la protection de l'anonymat il nous semble utile de faire évoluer cet enregistrement en utilisant les développements informatiques récents des différentes plate-formes électroniques du Service public Fédéral Santé Publique.

1. Proposition de construction d'une base de données fiable grâce à la plate-forme e Birth

Dans un avenir proche toutes les naissances déclarées seront centralisées de manière temporaire par e-Birth pour envoi à la maison communale et aux communautés. Les enfants sont identifiables par un **partus number**. Celui-ci comprend l'année de naissance, le code de la maternité et un numéro attribué par la salle d'accouchement. Le partus number est unique pour chaque enfant.

Nous proposons que e Birth effectue une **sélection des naissances** qui correspondent au critères d'inclusion de la base du Collège Newborn, càd. les enfants d'âge gestationnel inférieur à 32 semaines ou de poids de naissance inférieur à 1500g. Cette sélection de patients sera transférée sur le site « Newborn Collège ». Leur identifiant unique sera le partus number. Ceci évite toutes les difficultés d'utilisation du numéro national .

Les services NIC accueillent d'une part les enfants de leur propre maternité qui seront aisément identifiables grâce au code de l'hôpital qui figure dans le partus number. D'autre part certains enfants auront été transférés d'une maternité sans NIC. Ceux-ci feront l'objet d'une base de données séparée que les services NIC pourront interroger grâce au partus number du bébé qui leur a été transféré. Le site Newborn College pourra également vérifier combien d'enfants répondants aux critères ne sont pas soignés en NIC.

En pratique les NIC retrouveront tous les patients sur base du partus number. Lorsque eBirth transmet les données il faudra valider l'encodage du NIC. L'exactitude des données eBirth sont très importantes.

Au cours du suivi l'encodage à distance de la période néonatale pourra se faire sans erreur grâce au partus number qui est un identifiant unique. Cette information devra faire partie du dossier néonatal dont le médecin habilité à encoder doit avoir connaissance.

2. Proposition de contrôle de la confidentialité par la plate-forme e Health

Actuellement les patients sont encodés par les médecins des services Nic grâce à un login et mot de passe qui est global pour chaque unité. A l'avenir il est souhaitable d'avoir une surveillance plus personnalisée des médecins habilités à encoder des données patients, en particulier pour les données de suivi longitudinal.

L'identification des soignants via e Health donnera un accès contrôlé à la banque de données. Chaque soignant a un login et mot de passe attribué dans le cadre d'une convention avec e Health ou toutes les règles de confidentialité et de responsabilité ont été définies.

**Dataflow in de gegevensbank van het College Moeder en Pasgeborene (Sectie
Neonatologie). Integratie in de verschillende elektronische systemen van de Federale
Overheidsdiensten van de Volksgezondheid FOD e Birth en eHealth**
FIABILITEIT EN VERTROUWELIJKHEID

I. Huidige situatie van de database van het College Neonatologie

Het College Neonatologie registreert neonatale gegevens van premature kinderen met een geboortegewicht kleiner dan 1500g en een zwangerschapsleeftijd kleiner dan 32 weken. Drie van de « historische » 40 items werden onlangs aangepast en de items van Euroneonet ingelast. Ongeveer 1-1.5% van de geboortes wordt aldus geregistreerd (1500-1800 patienten/jaar).

De huidige registratie werd door Mijnheer C. Decoster, algemene secretaries van de Administratie van de Verplegingsdiensten, aan de **Commissie voor de Bescherming van de Persoonlijke Levenssfeer (CBPL)** in 2002 samen met de andere Colleges.

Dit jaar werd een nieuwe verklaring ingediend omdat wij van plan zijn follow-up gegevens toe te voegen alsook om de conformiteit van onze database na te gaan. Deze conformiteit werd door de CBPL bevestigd. Wel herinnerde men ons eraan dat elke dienst afzonderlijk in orde moet zijn ten overstaande van de CBPL voor het beheer van de database van zijn patienten. Dit kan aan de hand van een verklaring van het ziekenhuis voor al haar diensten. In sommige gevallen moet een dienst een verklaring inbrengen wanneer de gegevens voor andere doeleinden gebruikt worden dan die de verklaring van het ziekenhuis inhoudt.

De database van het College wordt vertrouwelijk beheerd door de voorzitter van het college onder de verantwoordelijkheid van de FOD Gezondheidszorg. De huidige vertrouwelijke website die de gegevens beheert noemt ‘Newborn College’ en is toevertrouwd aan de dienst Informatica van het UMC Sint-Pieter. De website laat een interactive benchmarking en tendensanalyse toe.

Anonymisatie van de patientengegevens

De database houdt geen nominatieve gegevens in, zoals naam, voornaam, identificatie van de moeder of nummer van het nationaal register

De huidige interne numerisatie zal in de toekomst door het partusnummer van e Birth vervangen worden.

Toegang tot de database

Het internet-dataverkeer ([https protocol](https://)) tussen gebruiker en de website wordt beveiligd door het Secure Sockets Layer systeem dat berust op een encryptieprocédé door middel van asymmetrische versleuteling.

De gebruiker heeft een login en een paswoord. In de toekomst zal de login via eHealth gebeuren. De gebruiker kan alleen zijn eigen patienten zien en nooit die van een ander ziekenhuis. Elke toegang naar patientengegevens wordt in een audit tabel geregistreerd.

Beveiliging van de database

De database bevindt zich op een van de servers van het datacenter van het UMC Sint-Pieter. De toegang hiertoe gebeurt met badge en is voorbehouden aan de verantwoordelijken van het systeem en van het systeemonderhoud. Elke toegang tot die zaal wordt automatisch in een controlebestand opgeslagen.

De serverzaal voldoet aan de normen van hoge beschikbaarheid wat betreft de opgeslagen data :

- Redundantie van de electrische stroomtoevoer (normaal circuit, hulpcircuit)
- Redundantie van het koelingsysteem
- Redundantie van de netwerkelementen
- Redundantie van de servers
- Redundantie van de opslagsystemen.

De database wordt meerdere keren per dag weggeschreven op hard disk en magneetband.

Wettelijk kader

De registratie wordt op vrijwillige basis door de Nic diensten uitgevoerd. De externe evaluatie van de kwaliteit door het college is niettemin een wettelijke verplichting (KB 15 februari 1999 , kwalitatieve evaluatie van de medische aktiviteit in het ziekenhuis).

Er zijn 2 problemen in de huidige registratie :

1. De database is onvolledig omdat sommige centra niet deelnemen : we hopen een positieve evolutie hiervan

2. Administratieve onjuistheden in de lijst van de patienten :

- A. Het is zeer waarschijnlijk dat sommige patienten **2 maal een ander identificatie nummer** krijgen en door 2 verschillende Nics worden ingebracht. Een uniek identificatie nummer is hiervoor de oplossing.
- B. Er bestaat geen contrôle over de **volledigheid** van de ingebrachte lijst van patienten. Dit hangt alleen af van de goede wil van de Nic diensten.

II. Toekomstperspectieven van de database : inclusie van follow-up gegevens

Men voorziet de neonatale gegevensbank uit te breiden met follow-up items op latere leeftijd (2 jaar, 5-6 jaar, eventueel later). **De personen die de follow-up gegevens** zullen inbrengen behoren niet noodzakelijk tot een Nic dienst en zullen een ander login moeten hebben dan de Nics. Het is wenselijk dat de zorgverleners een persoonlijk login hebben. De geregistreerde gegevens zijn **gevoelig** vermits ze de impact van prematuriteit nagaan op motorische, cognitieve en neurosensoriële ontwikkeling alsook op het gedrag en eventuele andere medische en sociale aspecten. Specifieke maatregelen voor vertrouwelijke en beperkte toegang zijn dus noodzakelijk.

Evolutie naar een meer zuivere database en betere bescherming van de anonymiteit dankzij de recente technologie ontwikkeld in de verschillende electronische systemen van de Federale Overheidsdiensten van de Volksgezondheid.

1. Uitbouwen van een zuivere database dankzij e Birth

In de nabije toekomst zullen al de geboorteverklaringen op het elektronisch platform eBirth terechtkomen. In een tweede stap worden de gegevens naar het gemeentehuis en de gemeenschappen, regio's doorgestuurd. De kinderen worden door een partusnummer geïdentificeerd. Dit nummer bevat het geboortejaar, de code van de materniteit en een nummer door de bevallingskamer toegewezen. Het partusnummer is uniek voor elk kind.

Wij stellen voor om aan eBirth de selectie te vragen van de patienten die aan onze inclusie criteria voldoen, nl. geboortegewicht minder dan 1500g of zwangerschapsleeftijd kleiner dan 32 weken. Deze selectie zal op de website « newborn college » terecht komen en het uniek patientnummer is het partusnummer. Dit vermindert de moeilijkheden die gepaard gaan met het gebruik van het nummer van het nationale register.

De Nic diensten nemen kinderen op van hun eigen materniteit alsook van andere materniteiten. Met het partusnummer die de code van de materniteit inhoudt zal het gemakkelijk zijn om de kinderen terug te vinden (zowel inborn als outborn).

Dit systeem zal ons ook toelaten na te gaan welke kinderen nooit op een Nic beland zijn. Wanneer e Birth de lijst van de patienten doorstuurt zal de Nic dienst dit moeten valideren. De juistheid van de gegevens van eBirth zijn belangrijk.

Tijdens de follow-up zal men aan de hand van dit uniek partusnummer de gegevens van de juiste patient inbrengen. Het partusnummer zal dus een belangrijk kenmerk zijn van de identificatie van de pasgeborenen en maakt deel uit van zijn dossier.

2. Controle van de vertrouwelijkheid dankzij e Health

Voor het ogenblik worden de patienten ingebracht door de Nicdiensten met een login en paswoord per dienst. Het is wenselijk om in de toekomst de toegang tot de database meer persoonlijk te maken, vooral wanneer het om follow-up gegevens zal gaan.

De identificatie van de zorgverlener via eHealth zal ons toelaten de regels van vertrouwelijkheid en verantwoordelijkheid strikt toe te passen.

Newborn-college

Product description:

Newborn-college is dedicated to:

Facilitate collecting data from European NIC centers.

- Giving online benchmarking and trend charts to all registered Nicus.

The major highlights of Newborn-college are:

- Intuitive, fast and easy to use.
- Can be adapted very quickly to new items, functionalities and projects.
- User can access database output instantly (validation to be defined).
- User can navigate in charts from top down to detail of population in drill through manner.
- Using "state of the art" technology in Web development.

Internal description

- Nic records are stored in Oracle Database as XML data.
- Copies of each Nic records are stored also in XML file.
- Intensive use of statistical and analytical functions from Oracle
- Web server is running under Apache/PHP
- Client interface use Firefox/JavaScript/Jquery/Ajax

Software characteristics:

- Database Oracle (11g V 2)
- Php (v5.2.9)
- Apache (v2.2)
